
I am stupid need help

Posted by Ivone - 2009/02/17 00:02

Ok, it happen.

I have different OS in different partitions on my PC and installed as well Window 7.

My PC is not booting via hard drive. Yes, I can change my BIOS to boot from CD drive, but I need to create bootable CD so it will work.

I can use my laptop (I am on it right now), and yes I can burn CD here as well.

If I burn UBCD on it will that work even if is not ISO, but just exe file?

Or HOW/what?

Please help.

TIA

BTW: when I try to boot, I get:

verifying DMI pool data (and stay like that)

I don't have floppy

hello

you wrote system is not booting from harddrive, whether boot record got overwritten?

in windows cd, you will find FIXMBR, using that can fix MBR issues

hope to hear further from you, thank you
